TECHNOLOGY & INNOVATION

LSI has been a technology forward company from the beginning, and we're still relentless in our pursuit of new innovations to deliver and bring to market. Our drive to innovate is rooted in our desire to find simple solutions to common problems that draw clear benefits for our customers. We're constantly searching for groundbreaking ways to support refueling and convenience stores, from a single location to a few thousand.

We were early to market with LED canopy fixtures. We were first to develop fixtures with drivers accessible below the canopy. We developed a controls system specifically tailored to the refueling station. We even designed all our fixtures to be controls agnostic and can even install third party systems from the factory floor.

LSI continues to innovate today with customer-centric industry leading technology to help save time in installation and maintenance, help attract customers and increase sales, and help reduce energy costs and give site owners the control systems they need.

FORWARD THROW TECHNOLOGY

The exclusive **Symmetric Combination Forward Throw** technology for the **Scottsdale Vertex (SCV)** and **Scottsdale Legacy CRUS** fixture provide the most advanced solution on the market for **lighting the forecourt—the area between the canopy and store**. Combined with made-to-order lumen and CRI packages, the SCV and CRUS are not only the most sophisticated canopy fixtures on the market, but a symbol of our leadership and technological innovation.

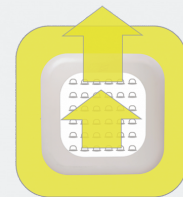

LSI Forward Throw Optic Technology allows Site Owners to:

- Address current site conditions without additional fixtures
- Improve the customer experience & retain your customer base
- Improve Site Safety

Without adding more fixtures to your canopy or having to bolt-on additional and sometimes poorly aimed flood lighting on top of your canopy; the LSI Forward Throw Optics evenly light the canopy and the area between your canopy and store.
